

CLAIMS:

1. A method for using the Internet, comprising the steps of:
entering character data indicating an operation desired by a user using a
telephone and sending the character data to a provider's server;
receiving the character data, using said provider's server, carrying out the
5 operation desired by the user based on the character data, generating display data
showing the result of the operation, and sending the display data to a broadcasting
station;
receiving the display data, using said broadcasting station, and radio-
transmitting the display data; and
10 radio-receiving the display data from said broadcasting station, using a
television set, and showing the result of the operation on the screen of said television set
based on the display data.
2. A method for using the Internet according to claim 1, wherein the character data
are entered and sent by the user using an Internet mail function of said telephone.
3. A method for using the Internet according to claim 2, wherein said telephone is
a mobile phone.
4. A method for using the Internet according to claim 1, wherein
said provider's server adds an identification code to the display data, and said television
set selects the display data based on the identification code.

5. A method for using the Internet according to claim 1, wherein the display data are radio-transmitted/received via a broadcasting satellite.

6. An Internet usage system, comprising:

a telephone which is used to enter character data indicating an operation desired by a user and to send the character data to a provider's server;

said provider's server which receives the character data from said telephone to
5 carry out the operation desired by the user based on the character data, said provider's server generates display data showing the result of carrying out the operation and send the display data to a broadcasting station;

said broadcasting station which receives the display data from said provider's server and radio-transmits the display data; and

10 a television set which radio-receives the display data from said broadcasting station, said television set displays the result of carrying out the operation based on the display data.

7. An Internet usage system according to claim 6, wherein said telephone is provided with an Internet mail function by which the character data are entered and sent to said provider's server.

8. An Internet usage system according to claim 7, wherein said telephone is a mobile phone.

9. An Internet usage system according to claim 6, wherein
said provider's server has a function to add an identification code to the display

data, and said television set selects the display data based on the identification code.

10. An Internet usage system according to claim 6, wherein

said broadcasting station is provided with a broadcasting satellite which is capable of radio-transmitting the display data.
